

## Equipment Supports and Bin Walls

### Texas Port Recycling/Houston, TX

TPR's upgrade to their Houston Facility included two material separators as well as adding four new material storage bins.

Our scope included casting 1200 yards of structural concrete and 400 yards of high performance 12" paving. We also erected the equipment structural supports including welding protective plates to the inside of the bin walls. The customer requested numerous field changes including relocating equipment and bin walls as the project progressed. The schedule was of utmost importance as the specialty contractor that was given the responsibility of installing the separators had a very narrow window in which to perform his work. All work was completed on schedule.
